Available with all standard connectivity
Factory terminated and tested
2mm ruggedised tails (900µm tails available)
Improved optical performance of loose tube structure

Overview

Specification

The compact MicroCable assembly is a flexible but rugged product with the improved optical performance of MicroCable structure. The standard 2mm patch lead style tails are hard wearing, which means they're up to the task of secure the optical fibre in the non-protected environments outside the patch panel or optical distribution frame (ODF).

Because the network topology can be reduced and simplified by direct connection to active equipment bypassing wall boxes, ODFs or fibre patch panels, the end result is a greatly improved power budget and reduced fibre management space.

Applications

- Internal short optical links
- Front panel/equipment connections
- Data centre infrastructure
- Storage Area Network (SAN)
