Overview	Features

MODIS is range of modular components that can be configured in to suit almost any connectivity platform required. This scalable platform enables the user to custom build and expand connectivity in the field.

All components are designed for 'low skilled' installation practices, meaning quick and easy installation and re-configuration using only basic hand tools. The components can be arranged ad hoc and wherever possible are interchangeable to create a versatile and flexible platform for service delivery.

MODIS is commonly used in our distribution nodes. It can also be configured to suit legacy assets and offers the ability to re-purpose assets (for example as part of a copper to fibre migration strategy).
