Integrated guide cap - Integrated guide eliminates constant guide cap switching
 Reliability of alignment – due to the alignment improvement, better cleaning is achieved
 Intuitive - intuitive design, easy to use
 Labour cost reduction - Reduces operation time by almost 50% and therefore, reduces labour cost

Overview

Features

We are proud to launch the next generation of our industry-leading One-Click™ range of cleaners – the revolutionary One-Click® Cleaner PRO LC.

The new One-Click™ Cleaner PRO features an integrated guide cap design that reduces cleaning time up to 50% by eliminating constant switching of caps for cleaning the ferrule end-face on connectors, in or out of bulkhead adapters. Its unique capless design reduces operation time by up to 50%, cutting down on labour costs while maximising productivity.

In addition, the One-Click™ Cleaner PRO boasts over 775 cleaning cycles, which is a significant increase over previous designs. Initially, these new cleaners will support LC and SC connector types.

The One-Click™ series of cleaners offers effortless cleaning with a single push action saving valuable time and allowing fibre technicians to focus on other critical tasks. The One-Click Cleaner PRO further simplifies and speeds up the removal of contaminants by eliminating the time-consuming process of guide cap switching for different connector types.

Application

Using a Dry (i.e. mechanical cleaning of the connector ferrule end-face with cleaning materials, with no chemical or solvent) cleaning process, the One-Click effectively cleans both oil and dust (loose contaminants) from the end-face making the connector ready for installation in an optical network.
