High dimensional accuracy in cross-section and longitudinal uniformity
Excellent optical property such as low loss and low polarisation crosstalk
Large selection of products by wavelength, coating and type of usage (Small radius bending, extreme temperature, etc.)
RoHS compliant

Overview

Features

Fujikura pioneered the manufacture of PANDA fibre (which stands for "Polarisation Maintaining and Reduced Absorption") in the 1970s and we are the global leader in Polarisation Maintaining Optical Fibres.

Fujikura PANDA fibres have superior polarisation-maintaining optical properties because of the symmetrical accuracy in the cross section and the uniform constitution of stress applying parts. Based on Fujikura's fibre technology, PANDA fibres have a universal quality with not only low polarisation-crosstalk and low attenuation, but also broad suitability for fusion splicing or optical connectors.

With low attenuation and excellent Birefringence for demanding applications, our fibres are the industry standard. We offer a wide range of PANDA fibres with operating wavelengths from 400nm to 1550nm and we also supply a wide range of coating types such as UV, UV/Polyamide PVC cord, flame retardant, reduced diameter, and Polyimide for high temperature applications. We also can manufacture custom polarisation maintaining fibres.

Applications

Pigtail for LD and Modulator and any polarisation dependent devices

0.98μm and 1.48μm Pump LD stabiliser

Up to 300°C ambient use

Spectroscopy analysis
